MARKET COMMENTARY

The iron ore future price continued to fluctuate within a narrow range today, with the main contract I2405 closing at 948.5, up 2.43% throughout the day. The spot price of imported ore ports in early trading increased by 5-10 yuan/mt compared with yesterday, and market trading sentiment has improved compared with yesterday. The transaction price of PBF in Shandong is around 985-1010yuan/mt, and the transaction price of PBF in the Tangshan area is around 1010yuan/mt, which is 10 yuan/mt higher than yesterday. According to SMM port inventory data, port inventories are still accumulating this week; port inventories at the national top ten main ports once again accumulated 1.02 million mt to 89.89 million mt from last week. Among them, crude fine and pellets are accumulated, while concentrate and lump iron ore are depleted. The profits of steel mills have mostly remained at low levels, but some steel mills have begun to take action to replenish their stocks before the Spring Festival holiday. Some steel mills have not yet started restocking depending on the price performance of iron ore. However, as subsequent steel mills begin to replenish their inventories, port inventory accumulation is expected to slow down, which will provide some bottom support for iron ore prices.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
