MARKET COMMENTARY

DCE iron ore futures rose in the day. the main contract closed 819 , an increase of 1.24% throughout the day; some traders quotation is still stronger, and Some steel mills purchased on demand. today's overall market transaction atmosphere in general. PBF at Shandong port dealt 815-820 yuan/mt; increased 0-5 yuan/mt over yesterday. PBF at Tangshan port dealt 830-835 yuan/mt; increased 0-5 yuan/mt over yesterday. SMM's total national construction steel inventory continued to increase by 1.21% month on month. The total inventory of hot coils increased slightly by 9600 tons. During the off-season of terminal demand, the accumulation of steel inventory is still acceptable. But the significant increase in building material production this week has raised concerns in the market about the increasing slope of future inventory accumulation. In addition, the fundamentals of iron ore itself are in a state of high supply, high demand, and high inventory. In the case of weak terminal demand, there is insufficient upward drive and short-term or narrow fluctuations.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
