MARKET COMMENTARY

DCE iron ore futures fall today by 3.43%. the main contract closed 775.5. some traders were negative to sell, Some steel mills tended to be wait-and-see, with a focus on purchasing at lower prices. PBF at Shandong port dealt 775-780 yuan/mt; increased 0-3 yuan/mt over yesterday. PBF at Tangshan port dealt 790-795 yuan/mt; the same as yesterday. On July 24th, SMM reported a blast furnace operating rate of 93.61%, a decrease of 0.55% compared to the previous month. The utilization rate of blast furnace capacity was 95.52%, a decrease of 0.45% compared to the previous period. The average daily iron production of the sample steel plant was 2.2901 million tons, a decrease of 9400 tons compared to the previous period. Recently, the price of threaded steel has dropped significantly, causing severe losses for steel mills. Some steel mills plan to overhaul their blast furnaces in August, which may lead to a continued decline in iron production. However, considering the approaching end of the month, the market still has expectations for the Politburo meeting, and it is expected that iron ore prices may have a short-term chance of bottoming out and rebounding.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
