MARKET COMMENTARY

DCE iron ore futures market bounced up from the continuous slump in the past few weeks, traders held their quotations relatively firm and PBF was closed at 1155-1160yuan/mt in Shandong market, mixed with small ups and downs over yesterday. As the price falling of mainstream medium iron ore products accelerated recently, including PBF has higher cost performance for the moment. SMM's data showed the price spread between PBF and SSF has shrank to current 380yuan/mt from more than 450yuan/mt in this early July. And thus, the prices for mainstream medium products in the short run will enjoy certain supports. Besides, according to SMM's calculation, steel mills profits for rebar have ascended to more than 660yuan/mt and that for HRC even reached more than 1000yuan/mt, based on iron ore price of 172USD/mt, which will stimulate steel mills' purchasing enthusiasms in raw materials, especially when majority steel mills have relatively low-level in-plant inventories.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
