MARKET COMMENTARY

The iron ore inventories across 35 ports tracked by SMM totaled 129.29 million mt, a decrease of 330,000 mt from the previous week, but up 14.24 million mt year-on-year. The arrivals of imported iron ore at ports increased, but the efficiency of port deliveries has been restricted, driving down the port inventory. The daily average deliveries from the 35 ports decreased 74,000 mt on a weekly basis to 2.67 million mt this week. The efficiency of port deliveries in many ports decreased amid the typhoon in east China early this week. Multiple blast furnaces have closed amid energy consumption control in Jiangsu, which have sharply reduced the restocking demand for iron ore and have resulted in significant drop in daily average deliveries from the ports. However, though the volume of imported ore arrivals is expected to pick up gradually, it is difficult for port deliveries to recover significantly in the short term due to production restrictions. Port inventory is expected to accumulate. The physical port stock prices dropped further by 60-70yuan/mt when DCE iron ore futures market plummeted continuously, some traders offered larger concessions on the prices while steel mills remained tepid procurements. PBF was closed at 750-780yuan/mt, down by 55-95yuan/mt over yesterday.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
