MARKET COMMENTARY

According to data tracked by SMM, 59 ships arrived at domestic main ports during September 13-19. Arrivals of cargoes are estimated to stand at 8.93 million mt, down 3.63 million mt from the previous session, and down 3.27 million mt year on year. Shipments that departed Australian ports were estimated to increase 1.27 million mt week on week and 3.47 million mt on the year to 18.74 million mt, and that from Brazilian ports rose 230,000 mt on the week and down 490,000 mt on the year to 6.1 million mt. Iron ore arrivals fell significantly from the previous session, but that from Australia and Brazil climbed on the week. While domestically speaking, the output of hot metal is expected to decline further amid production reduction policies. The overall supply of iron ore is likely to remain sufficient in the short term. DCE iron ore futures market today vibrated narrowly and the physical port stock transaction prices for PBF rose by 15-30yuan/mt over yesterday. Traders turned to be cautious in making deals, while mills showed no big interests in purchasing as well, total transactions inched down over yesterday.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
