MARKET COMMENTARY

DCE iron ore futures continued to rise largely today，the main contract I2401 closed 817, an increase of 3.68% throughout the day; some traders were active to sell, and there is a demand for some end of month delivery resources; The steels procurement more cautious, The overall market transaction atmosphere has weakened today. PBF at Shandong port dealt 899 yuan/mt; the same as yesterday. PBF at Tangshan port dealt 899 yuan/mt; the same as yesterday. The operating rate of blast furnaces in SMM research remained unchanged month on month, but the utilization rate of production capacity and molten iron production slightly improved. The rigid demand procurement of steel mills still provides strong support for iron ore prices. In the off-season of terminal demand, the shipment of finished products is average, and the price increase of finished products is not as high as that of iron ore. Steel mills' profits shrink, and negative feedback pressure increases. However, in the short term, policies can stimulate market sentiment, and mining prices are prone to rise but difficult to fall. In the short term, they may continue to be strong and volatile.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
