MARKET COMMENTARY

Today DCE iron ore futures exhibited a firm trend, with the most active I2609 contract ultimately settling at 778.5 RMB per tonne, representing an increase of 0.39 per cent from the previous trading session. Conversely, physical spot prices experienced a decline of 3 to 5 RMB per tonne compared to the preceding day. Whilst traders actively presented their offers, steelmakers procured strictly on an as-needed basis, resulting in a scarcity of market inquiries and a largely muted overall physical transaction environment. Regarding fundamental data, the latest statistics from SMM indicate that aggregate iron ore inventories across 35 major national ports stood at 152.58 million tonnes, marking a period-on-period decline of 610,000 tonnes and reflecting a marginal destocking trend. Over the same period, the average daily port clearance volume rebounded to 3.13 million tonnes, representing a week-on-week increase of 60,000 tonnes. The modest inventory drawdown observed at the ports this week underscores the robust nature of underlying iron ore demand. Given that blast furnace operating rates remain at elevated levels, port clearance volumes are anticipated to sustain an upward trajectory in the near term, thereby providing solid downside support for iron ore valuations. Looking ahead to next week, the anticipated release of physical port inventories may temporarily augment iron ore supply, which will likely dampen upward pricing momentum. Taking these fundamental variables into comprehensive consideration, iron ore valuations are expected to predominantly maintain a range-bound, volatile trajectory over the forthcoming week.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
