MARKET COMMENTARY

Today, DCE iron ore futures trended stronger, with the most-traded I2605 contract closing at 753.5 RMB/ton, an increase of 0.67% from the previous trading session. In the physical market, spot prices were broadly unchanged from the prior day. Trader sentiment for offering cargoes was subdued, and steel mill procurement was largely confined to immediate requirements, with a widespread wait-and-see approach being adopted. Consequently, the overall trading atmosphere in the spot market was somewhat lackluster.

An SMM survey indicates that the impact of blast furnace maintenance on hot metal production this week amounts to 1.8088 million tons, an increase of 61,600 tons week-on-week. This impact is projected to decrease by 88,100 tons next week. Currently, hot metal output remains somewhat suppressed due to environmental policy restrictions.

However, as the resumption of work progresses following the holiday period, production is expected to stage a notable recovery.

Furthermore, iron ore inventories at steel mills were significantly depleted during the Spring Festival holiday and are now at a relatively low level, which is expected to create a window for restocking and thereby drive an improvement in demand. However, considering that portside inventories remain at an elevated level and daily offtakes from ports have yet to show significant improvement, iron ore prices are unlikely to overcome significant upward resistance in the near term and are expected to maintain a range-bound trajectory.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
